

## Volume Attenuator & Limiter

**Important Information:** Always turn down the gain before connecting the Invisicom earpiece and then gradually increase to a comfortable level. Ensure care is taken to avoid listening at high volume levels. Long term exposure to excessive volume can lead to hearing damage.

An optional **attenuator** is available and should be used to reduce the output volume during normal use. It does not set a maximum output but reduces the level for any volume setting.

An optional volume **limiter** (preventing high volume levels above 85dB) is also available as upon request. This allows normal volume adjustment but up to a reduced maximum for increased safety.

See separate Technical Specifications document for more information.
